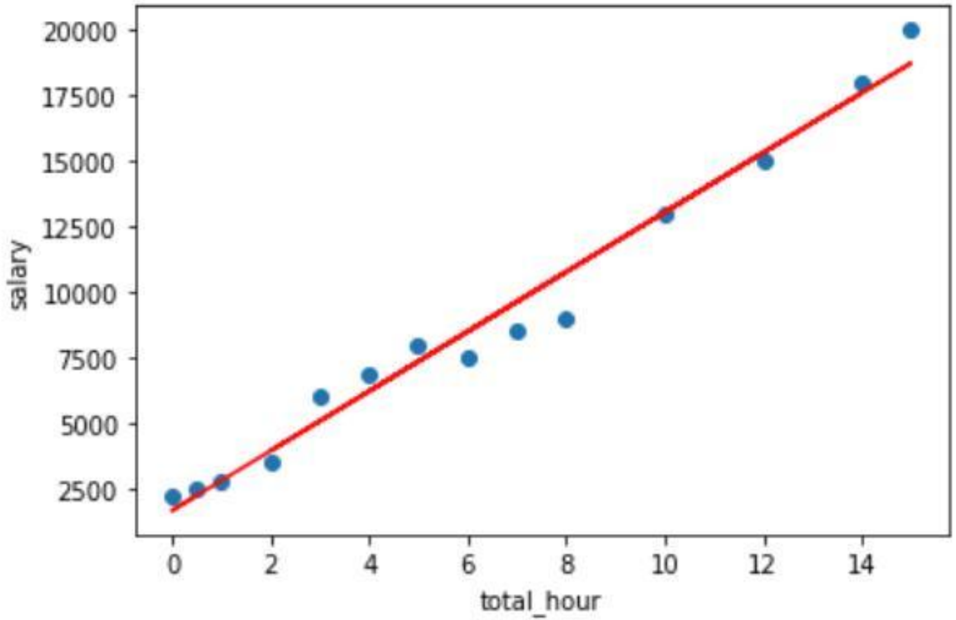
Linear Regression



$$h_\theta(x^{(i)}) = \theta_0 x_0 + \theta_1 x_1 + \ldots + \theta_i x_j$$

$$x_0 = 1, \quad j = the\ number\ of\ features$$

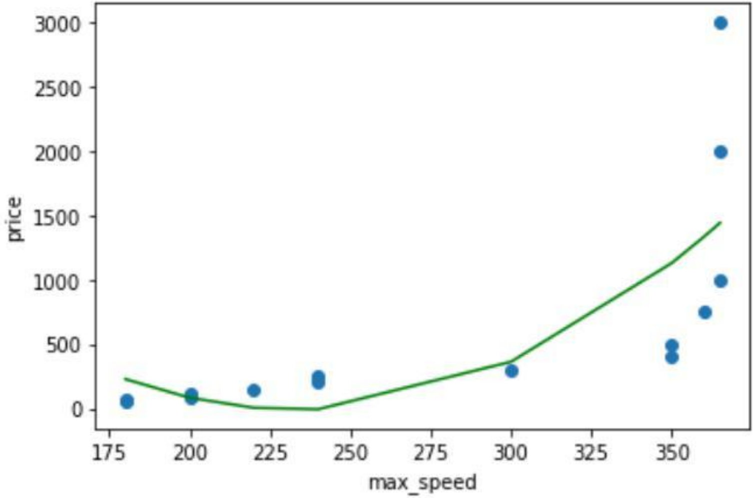
$$Least\ Squared\ Error = \frac{1}{2}(h_\theta(x^{(i)}) - y^{(i)})^2$$

$$Cost\ Function = J(\theta) = \frac{1}{2m}\sum_{i=1}^{m}(h_\theta(x^{(i)}) - y^{(i)})^2, \quad m = number\ of\ sample\ data$$

Derivative of cost function at θ_j:

$$\frac{\partial J(\theta)}{\partial \theta_j} = \frac{1}{m}\sum_{i=1}^{m}(h_\theta(x^{(i)}) - y^{(i)})x_j^{(i)}$$

Polynomial Regression



Simple Linear Regression

$$y = b_0 + b_1x_1$$

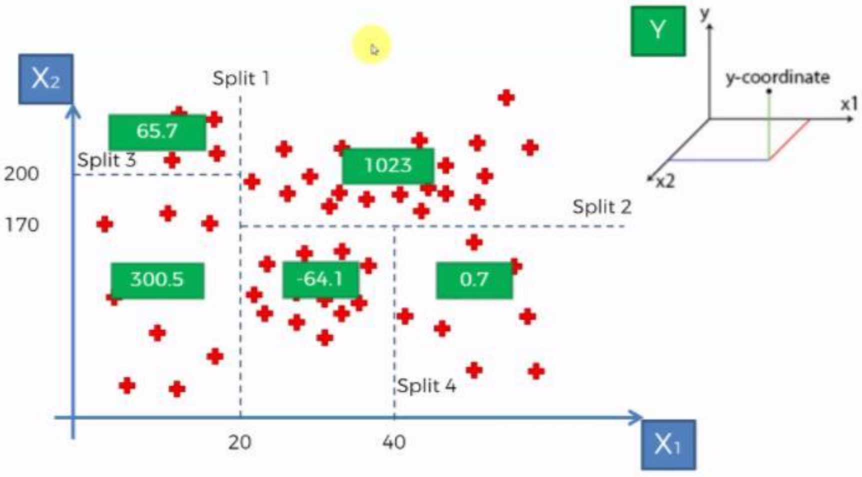
Multiple Linear Regression

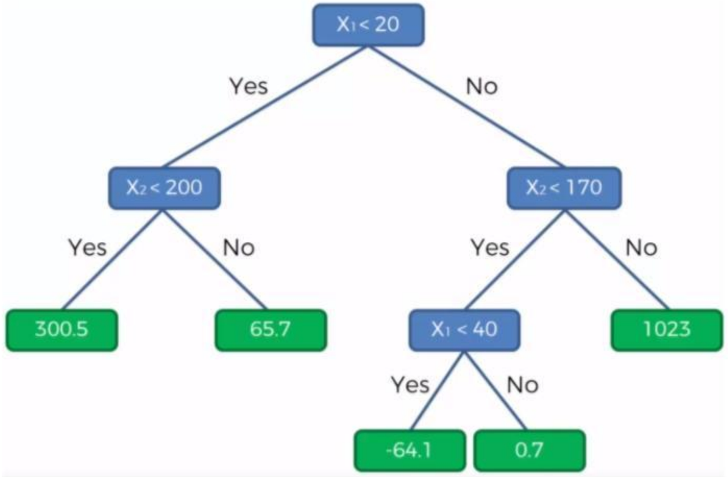
$$y = b_0 + b_1x_1 + b_2x_2 + \ldots + b_nx_n$$

Polynomial Linear Regression

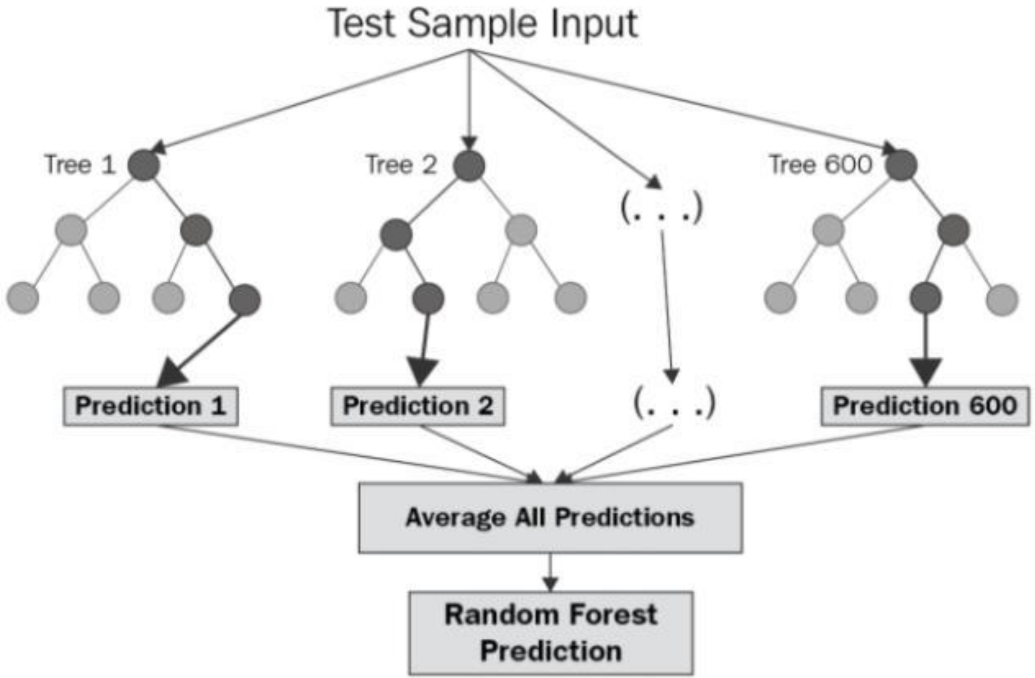
$$y = b_0 + b_1x_1 + b_2x_1^2 + \ldots + b_nx_1^n$$

Decision Tree Regression

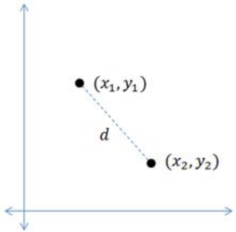




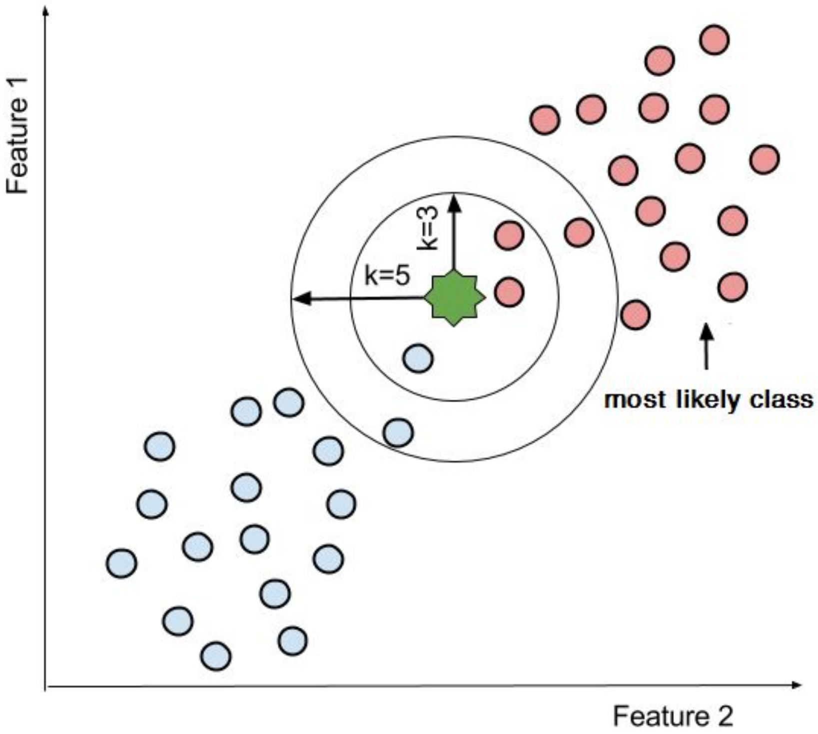
Random Forest Regression



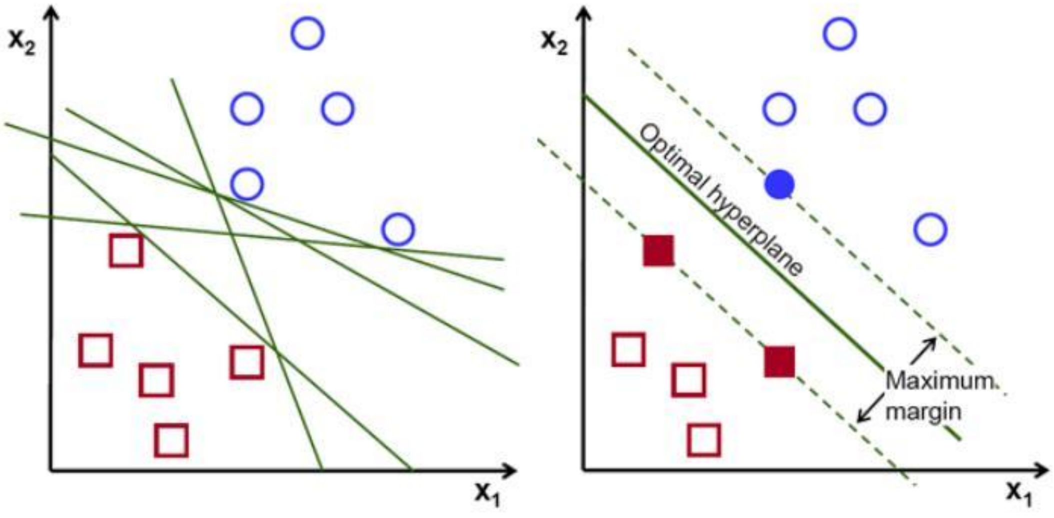
KNN Classification



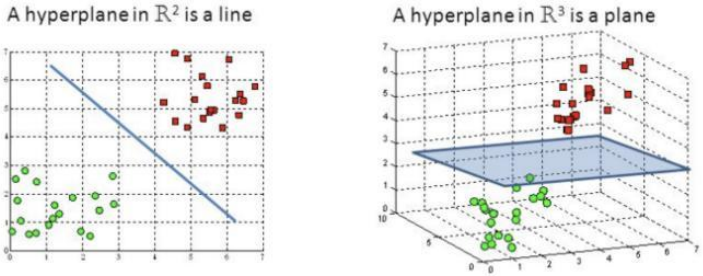
$$d = \sqrt{(x_1 - x_2)^2 + (y_1 - y_2)^2}$$



SVM



Possible hyperplanes



To separate the two classes of data points, there are many possible hyperplanes that could be chosen.
Our objective is to find a plane that has the maximum margin, i.e the maximum distance between data points of both classes

K-means Clustering

- For Cluster 1, we only have one point A1(2, 10), which was the old mean, so the cluster center remains the same.

- For Cluster 2, we have ((8+5+7+6+4)/5, (4+8+5+4+9)/5) = (6, 6)

- For Cluster 3, we have ((2+1)/2, (5+2)/2) = (1.5, 3.5)

K-means Clustering

- In Cluster 1, we have points 1 and 8. Therefore the centroid is: $((2+4)/2,(10+9)/2)=(3,9.5)$
- In Cluster 2, we have points 3,4,5 and 6. Therefore, the centroid is: $((8+5+7+6)/4,(4+8+5+4)/4)=(6.5,5.25)$
- For Cluster 3, we have points 2 and 7. Therefore, the centroid is: $((2+1)/2,(5+2)/2)=(1.5,3.5)$
